

The boar in the W class weighed in at a whopping 500 pounds but only had a total of 4 inches of bottom tusk. The boar in the T class weighed in at 300 pounds but had a grand total of 8 inches of bottom ivory. Both boars have a total of 6 inches of bottom tusk circumference. These boars' numerical score is equally impressive. We doubt if anyone would say that one boar is a far greater trophy than the other. It all comes down to personal preference when deciding which is favored. If both boars were standing down range at 200 yards, which one would you pull the trigger on? This is why the **WWT** scoring system classes the two boars separately, so they can compete against other boars that are physically similar. This makes the **WWT** scoring system the most fair and accurate way to score and classify all wild boars taken in any part of North America or the world, for that matter.

All scoring must be done by an official scorer. *Wild Boar USA* is continually adding official scorers throughout different regions of the country. It is the hopes of all involved that the scoring system will help boar hunting surge forward in both popularity and respect while at the same time allowing documentation and competition between all giant boars taken.

As score cards come in, the record books are updated. Tell the hunters to check our website to see their ranking at [www.wildboarusa.com](http://www.wildboarusa.com) . Once a year the official "TOP 10" boars taken the previous year in both W and T classes will be posted on the website. This will also add a spark of competition and anticipation between hunters, ranches, states, regions, and countries. Please contact us with any questions at 866-307-1999.
